

PSYCHOLOGY

Stage 3

WACE Examination 2011

Marking Key

Marking keys are an explicit statement about what the examiner expects of candidates when they respond to a question. They are essential to fair assessment because their proper construction underpins reliability and validity.

When examiners design an examination, they develop provisional marking keys that can be reviewed at a marking key ratification meeting and modified as necessary in the light of candidate responses.

Section One: Research methods

20% (20 Marks)

Question 1

A psychologist was interested in the relationship between how strongly a person identifies with a particular ethnic group (ethnic identity) and their resilience to stress. The psychologist collected questionnaire measures of ethnic identity and resilience from 300 volunteer adults.

- (a) State an hypothesis that the psychologist could develop for this study.

Description	Marks
General instructions: Any response that indicates a <u>specific prediction</u> about the nature of the relationship AND <u>specifies the two variables</u> is acceptable for one mark. The predicted relationship might be a <u>positive</u> correlation/relationship OR a <u>negative</u> correlation/relationship. Examples of correct responses: - Higher levels of ethnic identity will be associated with higher resilience to stress - Lower levels of ethnic identity will be associated with higher resilience to stress - There will be a positive correlation/relationship between ethnic identity and resilience to stress - There will be a negative correlation/relationship between ethnic identity and resilience to stress - If an individual has a strong ethnic identity then they will have a higher resilience to stress. Guidelines for incorrect responses: A response that <u>does not predict the specific direction</u> of the relationship between the variables AND/OR <u>does not specify the names of the variables</u> is not acceptable. For example: - Ethnic identity will be related to resilience to stress (does not specify direction of relationship) - There will be a positive relationship between the variables (does not name the variables) - There will be a relationship between the variables (does not specify the direction of the relationship or name the variables)	1
	Total 1

Question 1 (continued)

- (b) (i) Identify the nature of the relationship between the two variables shown in the scattergram.

Description	Marks
General instructions Any response that indicates a <i>positive</i> association/correlation/relationship is acceptable for one mark. Given that the term 'relationship' is in the question, the candidate need not repeat this word. The word 'correlation' is <u>not</u> required for a correct response. Examples of correct responses • Positive (relationship/correlation) • Moderate/strong positive (relationship/correlation) • As ethnic identity increases, resilience to stress increases • Higher ethnic identity is associated with higher resilience to stress	1
	Total 1

- (b) (ii) Do the results shown in the scattergram support the hypothesis stated in Question 1(a)?

Description	Marks
General instructions Response must be evaluated for each candidate individually in relation to their response for Question 1(a). Candidates who presented an hypothesis stating that there would be a positive relationship between the variables, should respond YES for one mark. Candidates who presented an hypothesis stating that there would be a negative relationship between the variables should respond NO for one mark.	1
	Total 1

Question 1 (continued)

- (c) (i) Describe a limitation of the research design used in this study that affects the conclusions that can be drawn from the results.

Description	Marks
General instructions Candidates may identify any of the below limitations of the research design. Any one answer is acceptable for one mark. Examples of correct responses could include, but are not limited to: <i>Limitation - Correlational design</i> <i>Sample correct responses</i> • The study uses a correlational design therefore the researchers cannot tell whether ethnic identity is causally related to resilience to stress. • The results do not show causation between the variables • There may be other factors that might account for the results <i>Limitation – Cross sectional study</i> <i>Sample correct responses</i> • The study only collected data at one point in time, so the researchers cannot tell whether the variables are related to each other over time • Because the data on ethnic identity and resilience were both collected at the same point in time, the researchers cannot tell whether one variable actually causes changes in the other variable. <i>Limitation – Sampling</i> <i>Sample correct responses</i> • There is no information about how the sample was recruited or whether the sample is a random sample. We do not know whether results would generalise to or are representative of the whole population • The researchers only sampled adults, so there is no information about ethnic identity and resilience in children or adolescents • There is no information about the range of cultural/ethnic diversity in the sample, so the researchers cannot conclude that the results represent people from all different cultural and ethnic backgrounds <i>Limitation – Use of self-report/questionnaire measure of resilience</i> <i>Sample correct responses</i> • Questionnaires are subjective quantitative measures, so you do not know whether everyone is responding to the questions in the same way. • Using a questionnaire might not be the most valid way of obtaining information about an individual's resilience to stress; use of a more objective measure may be more appropriate so that responses are not skewed by factors such as social desirability Examples of incorrect responses • Use of a questionnaire for assessing ethnic identity is not a limitation of the study because this relies on an individual's subjective self-report.	1
	Total 1

Question 1 (continued)

- (c) (ii) Describe an alternative research design that the researchers could use to overcome the limitation identified in Question 1(c)(i).

Description	Marks
General instructions Response to 1 (c) (ii) must be logically related to the candidate's response to Question 1 (c) (i). For two marks, the candidate must indicate the alternative design AND <u>how</u> this would overcome the limitation. Examples of correct responses <i>For limitations related to cross sectional / correlational design</i> • Longitudinal study or sequential study (1 mark) • The researchers could use a longitudinal study / collect data at more than one time so that they can look at changes in the variables over time. (2 marks) • The researchers could collect data on other variables that might also be related to resilience to stress (2 marks) <i>For limitations related to use of self-report/questionnaire measure</i> • Use an objective quantitative measure (1 mark response) • The researchers could collect information about resilience in another way rather than just relying on a questionnaire, for example use interviews, or observational methods (2 marks) • The researchers could collect physiological (objective quantitative) measures of stress, e.g. cortisol levels, blood pressure. (2 marks) <i>For limitations related to sampling</i> • Collect more data / include more people in the study (1 mark responses) • The researchers could collect data from a larger sample of people so that the results are more generalisable (2 marks) • The researchers could make sure that the included people from a range of cultural and ethnic backgrounds in their sample (2 marks) • The researchers could include children and adolescents as well as adults in the sample (2 marks) Examples of incorrect responses Using a subjective quantitative measure or using a Likert scale.	1–2
	Total 2

Question 2

A research study was conducted to determine the effectiveness of a herbal treatment for children with Attention Deficit/Hyperactivity Disorder (ADHD). One hundred and twenty children aged 6-12 participated in the study. Eighty children in the Treatment group were given a herbal medicine for four months. The 40 children in the Control group were given a substance that looked, smelt, and tasted similar to the herbal medicine but which did not contain any active ingredients. The children and their parents were not told which treatment they were receiving. Children completed pre-treatment and post-treatment measures of attention, where higher scores show better attention.

The results of the study were as follows:

	Average pre-treatment score	Average post-treatment score	Results of the statistical test on the difference between pre- and post-treatment scores
Treatment group	85.6	97.9	$p < 0.05$
Control group	88.8	84.3	$p > 0.05$

- (a) (i) Identify the dependent variable for the study.

Description	Marks
Attention (score)	1
	Total 1

- (a) (ii) Identify the independent variable for the study.

Description	Marks
Examples of correct responses: - The type of treatment/treatment type (1) - Herbal versus placebo (1) - The herbal treatment versus control treatment (1) Any one of the above, one mark Note: Responses 'herbal treatment' or 'herbal medicine' should not be awarded a mark.	1
	Total 1

Question 2 (continued)

- (b) (i) State the conclusion that the researchers could draw from the results for the Treatment group.

Description	Marks
General instructions The candidate must recognise that the results for the Treatment group <i>were statistically significant</i> – that is, after the treatment, children's attention scores were significantly higher than before the treatment. Examples of correct responses • The herbal treatment (significantly) improved attention in the treatment group • The children who took the herbal treatment improved (significantly) in their attention • The results were significant • The results were not due to chance	1
	Total 1

- (b) (ii) State the conclusion that the researchers could draw from the results for the Control group.

Description	Marks
General instructions The candidate must recognise that the results for the Control Group <i>were not statistically significant</i>—that is, after the treatment, children's attention scores were not significantly different to their pre-treatment scores. Examples of correct responses • The students in the control group showed poorer/lower attention after the no treatment but this was not statistically significant • There was no significant change in attention in the children in the control group • The placebo had no significant effect on children's attention. • The results were not significant • The results could be attributed to chance Examples of incorrect responses • The children in the Control group had worse/lower attention scores after the treatment than before the treatment • The Control treatment made children's attention worse	1
	Total 1

Question 2 (continued)

- (c) Explain why the Control group was given an inactive substance.

Description	Marks
General instructions For one mark, the candidate MUST mention the term placebo and for two marks the candidate should explain the role of a placebo as a control in the experiment. Examples of correct responses • To test whether the results were due to the placebo effect (1 mark) • The control group got the placebo treatment (1 mark) • The control group did not get the real treatment to allow the researchers to tell whether the herbal treatment really had an effect/ really worked (1 mark) • To see whether the herbal treatment had a statistically significant effect on the children's attention (1 mark) • The control group received a placebo to allow the researchers to tell whether the herbal treatment actually worked or whether the results are due to beliefs about the treatment (2 marks) • The placebo was given to one group of children to see if their attention improved just because they thought/believed/expected that they were getting a treatment (2 marks) • To test whether the change in the dependent variable is actually due to the independent variable (2 marks) •	2
	Total 2

Question 3

- (a) Outline what is meant by the term 'informed consent' in research in psychology?

Description	Marks
General instructions Any correct definition acceptable for one mark. Examples of correct responses - Informed consent means that participants in research must be told exactly what the research involves and any consequences for them (so that they can make the decision whether or not to participate). - People must be informed/told about exactly what will be involved if they decide to take part in the research. - The researcher must explain to the participants what the research involves, so that they can make up their mind whether or not they want to take part.	1
	Total 1

- (b) (i) How would a psychologist define the term 'confidentiality'?

Description	Marks
General instructions Any correct definition acceptable for one mark. Examples of correct responses Confidentiality is - the understanding/agreement between a psychologist and a participant that any information that is disclosed within that relationship stays within that relationship - the assurance given by the psychologist to their research participant that all the information they provide will be kept private and not disclosed to others without the person's permission. - the ethical and legal promise made by the psychologist to keep all information private/secret, except if the person consents to information being disclosed to others.	1
	Total 1

Question 3 (continued)

- (b) (ii) Give **two (2)** reasons why confidentiality is important in research in psychology.

Description	Marks
General instructions Any two correct responses are acceptable for one mark each. Examples of correct responses • Protect the privacy/identity of the participant • Respect the rights of the participant • Help the participant to trust the psychologist • To demonstrate loyalty to the relationship with the participant • Confidentiality is required as part of the Code of Ethics for psychologists • Without assurance of confidentiality, people might not agree to participate in research • Ensure that participants will be safe/not be harmed by their information being disclosed to others (e.g. legal implications of behaviour). • To keep participants anonymous	1–2
	Total 2

Question 3 (continued)

- (c) Psychologists use twin studies and adoption studies to study the effect of nature versus nurture on development. Explain **two (2)** ethical issues that a psychologist would have to consider when conducting this kind of research.

Description	Marks
General instructions Any <i>two different</i> ethical issues are acceptable. Detailed description of the ethical issue, in the context of twin and adoption studies is to be awarded two marks. Less well explained or less detailed answers to be awarded one mark each. Examples of correct responses <i>Possible Ethical issue—cannot conduct experimental research</i> <i>Sample responses</i> • Psychologists cannot take children away from their parents/siblings (1 mark) • Psychologists cannot put children into a bad environment (1 mark) • Psychologists cannot remove children from their families to randomly allocate children to conditions of being raised by biological parents or non-biological parents. (2 marks) • Psychologists cannot set up experimental conditions where some children are raised in positive family environments and other children are raised in harmful or negative family environments. (2 marks) <i>Possible Ethical issue – Informed consent and right to withdraw</i> <i>Sample responses</i> • The psychologist must get informed consent from the participants (1 mark) • The participant has the right to withdraw at any time. (1 mark) • The psychologist must tell the children's parents exactly what the research involves and get their permission for the child to take part in the research (2 marks) • The psychologist must obtain informed consent from the parents (2 marks) • The psychologist must not deceive the participants about what the research is about (2 marks) <i>Ethical issue – Confidentiality</i> <i>Sample responses</i> • Psychologists must keep all information confidential (1 mark) • Psychologists must take care to store information securely to protect the participants' right to confidentiality (2 marks)	1–4
	Total 4

Section Two: Short answer

50% (50 Marks)

Question 4: Biological Influences

Question 4

- (a) Name **one (1)** neurotransmitter and describe **one (1)** effect of this on the human nervous system.

Description	Marks
General instructions Candidate to name <i>one specific</i> neurotransmitter for one mark. Spelling does not need to be correct as long as the intended word is clear. Any correct effect on the nervous system of the neurotransmitter to be accepted for one mark. Examples of correct responses • Noreadrenalin/Norepinephrine – boosts mood OR reduces symptoms of depression OR maintenance of alertness, drive and motivation; memory retrieval • Serotonin – boosts mood OR reduces symptoms of depression • Dopamine – experienced as pleasure; involved in learning and attention; involved in movement • Endorphins – boost mood, can be experienced as a ‘runner’s high’ after vigorous exercise OR blocks pain • Acetylcholine – used in brain cells involved in cognitive functions such as memory, thinking and judgement Guidelines for incorrect responses Any response that refers to the name of a psychotropic medication rather than a neurotransmitter is incorrect (e.g. Prozac, Valium, Fluoextine, antipsychotics) Acceptable responses do not include things like nerves and synaptic nobs.	1–2
	Total 2

Question 4 (continued)

- (b) Explain how neurotransmitters work in communicating messages between neurons.

Description	Marks
General instructions One mark allocated for each of the points below to a maximum of 4 marks. Correct technical terminology not required for full marks – see examples of alternative acceptable terminology in sample responses. Correct responses - Neurotransmitters can have an excitatory or inhibitory effect (1 mark) - An action potential travels to the axon terminals/end of the axon (1 mark) - Chemicals/neurotransmitters are released from the presynaptic neuron / the sending neuron (1 mark) - The chemicals/neurotransmitters travel across the synapse / synaptic cleft / gap between neurons (1 mark) - The chemicals/neurotransmitters bind to receptors in the postsynaptic neuron / the receiving neuron delivering their specific message. (1 mark)	1–4
	Total 4

- (c) (i) Name **two (2)** research techniques that are used to study the nervous system in humans or animals.

Description	Marks
Examples could include but are not limited to: - Case studies involving injuries to the brain from an accident or disease. (1 mark) - Microscopy / using a microscope / electron microscope (1 mark) - Electrical or chemical stimulation of the brain (1 mark) - Removing parts of the brain / ablation or lesions (1 mark) - Post mortem dissection and analysis - Various scanning techniques / MRI / PET / CAT scan (1 mark each) - EEG (1 mark) - Deep Brain Stimulation (DBS) (1 mark) - Measuring of brain waves (1 mark)	1–2
	Total 2

Question 4 (continued)

- (c) (ii) Explain the significance of research involving animals to the understanding of the anatomy and physiology of the human brain. (2 marks)

Description	Marks
General instructions Any response that relates to the benefits of animal research for understanding human brain structure and function is acceptable. Two marks for two different responses or one detailed point. Example correct responses • Psychologists can look at the similarities between animal and human brains and behaviour (1 mark) • Psychologists can do experiments on animals that they might not be able to do on humans (1 mark) • By studying animal brains we can make predictions and inferences about the functioning of the brain and behaviour in humans. (2 marks) • Study of animal brains has furthered what we know and understand about vision or sleep or motor skills or attention or temperature regulation or localisation of behavioural functions to areas of the brain or reproductive behaviour or avoidance behaviour in humans (mention any specific example of an advance in knowledge related to human behaviour from animal research) (2 marks) • Experiments on humans might not have been given ethical approval, so if this research on animals was not done, it might mean that certain discoveries might not have been made. (2 marks) • Researchers can manipulate/control the environment of animals to be able to study the effects of these changes (2 marks) • The shorter lifespans of many animal species that are used in research mean that experimenters can study changes related to ageing much more easily (2 marks) • The simplified nervous system of some animals can be used to study basic processes more easily and this knowledge can then be used to generalise to humans (2 marks).	1–2
	Total 2

Question 5: Cognition

- (a) Describe **two (2)** ways in which human cognitive processing can be related to the working of a computer. (2 marks)

Description	Marks
General instructions Any two of the following points for one mark each: Example correct responses • Both have limited processing capacity (1 mark) • Both take in information / input, process it, and produce an output (1 mark) • Human nervous system/brain is like the hardware of the computer (1 mark) • Strategies and rules for processing information is like the software of a computer (1 mark) • Information can be stored in memory and retrieved, like from a hard-drive (1 mark)	1–2
	Total 2

- (b) (i) Name **two (2)** cognitive skills. (2 marks)

Description	Marks
General instructions Any two of the following responses are permitted for one mark each: Example correct responses Note: Two specific examples in one domain acceptable for 2 marks, e.g. memory retrieval and memory storage accepted for 2 marks. • Attention • Memory • Executive functioning • Planning / organising / inhibiting responses • Concentration • Language • Thinking • Problem solving • Reasoning • Perception • Learning • Judgement • Decision making • Object permanence Guidelines for incorrect responses Responses that refer to <i>behaviours</i>, rather than cognitive skills, are not awarded marks; for example hyperactivity, trouble sitting still; forgetting things, getting distracted, trouble taking turns; acting without thinking. Information processing or processing not accepted for one mark.	1–2
	Total 2

Question 5 (continued)

- (b) (ii) Give **one (1)** example of how **each** cognitive skill identified in Question 5(b)(i) could be shown in a person's behaviour.

Description	Marks
General instructions Any example of a behaviour that accurately relates to the cognitive skill is acceptable for one mark each. The same generic example of behaviour cannot be counted as evidence for both points (e.g. "having difficulty paying attention"). Behaviours below particularly refer to behaviours in individuals with ADHD, as this is the example given in the syllabus (and the Garton & Fletcher textbook). Correct answers are not limited to the following responses. Examples of correct responses <i>Sample behaviours for Attention</i> - Person might appear not to be listening; person might not be looking at someone speaking; might not be able to sit still; fidgeting; distracted from tasks <i>Sample behaviours for Memory</i> - Forgetting information/things; losing things; asking for information to be repeated; doing some behaviour that is not appropriate/not what they are supposed to be doing at the time; getting lost; missing appointments <i>Sample behaviours for Executive functioning / planning, organising, inhibiting responses</i> - Losing belongings / things; poor time-management; butting into conversations; having difficulty waiting turn; forgetting where they are up to in complex tasks; acting without thinking; calling out a comment/answer before the question has been finished <i>Sample behaviours for Concentration</i> - Not able to concentrate on a task for a long period of time; easily distracted; losing one's place when reading; not being able to read or study efficiently	1–2
	Total 2

Question 5 (continued)

- (c) Name and describe **two (2)** behaviour modification strategies that can be used to change behaviour in people with ADHD. (4 marks)

Description	Marks
General instructions 1 mark response – naming the strategy 2 mark response – name plus description of the strategy/example of use of the strategy. Correct responses do not have to contain all of the detail of the sample descriptions, as long as the strategy is described in sufficient detail to be recognisable as correct - Behaviour contract (1 mark) The desired behaviour is identified and agreed upon by the teacher/parent and child. The teacher/parent and child agree on the reward that the child will receive for demonstrating the behaviour and the consequence for not demonstrating the desired behaviour. The child receives the reward/consequence in response to their behaviour. (1 mark for correct description) - Token economy (1 mark) (generic description such as ‘star-chart’ also acceptable) The teacher/parent and child agree on the desired behaviour. The child receives a ‘token’ every time they demonstrate the desired behaviour. Once the child has earned a certain number of tokens, he/she is able to exchange them for a reward. (1 mark) Other strategies could include: - Social skills training - Self-control training - Relaxation skills - Anger management training Guidelines for incorrect responses Medication/drugs/pharmacological treatments are not to be accepted as an example of a ‘behaviour modification strategy’.	1–4
	Total 4

Question 6: Communication

- (a) Explain what is meant by the term 'communication style'. (2 marks)

Description	Marks
General instructions For two marks, candidate must refer to two different aspect of communication style, including language, non-verbal communication, cultural influences. Example correct responses • It is the way we talk and the language we use (1 mark) • Cultural and social aspects of language (1 mark) • Made up of accents, vocabulary, grammar and the ideas being expressed (1 mark) • Is influenced by/depends on culture, gender, socio-economic background (1 mark) • Cultural and social aspects of language that are affected by gender, culture, socioeconomic status (2 marks) • The way that we use language, including things like our accents, vocabulary, grammar, and the ideas we express (2 marks) • The individual way that we communicate, including our use of language such as our vocabulary and accent, body language, that is affected by our culture, gender, etc (2 marks) Guidelines for incorrect responses The following are examples that are insufficiently sophisticated/detailed to be awarded a mark on their own. May be combined with one or more of the above points for a mark. Sample 0 mark responses • It is the way we talk • The way we use language • The language we use • The way we communicate	1–2
	Total 2

Question 6 (continued)

- (b) Name **two (2)** of the three social skills identified by Robinson and give an example of how each is used by adults to regulate their social relationships.

Description	Marks
General instructions Any two of the following three examples of Robinson's social skills allowed for one mark each – shaking hands, terms of address, being polite/politeness. Any logically related example of how these social skills could be used is acceptable for one mark each. Sample correct responses Shaking hands (1 mark) Examples of use (1 mark) – a formal hand-shake when you meet someone for the first time as a sign of respect; a formal hand-shake to mark a deal or agreement; a casual hand-shake between friends in greeting each other Terms of address (1 mark) Examples of use (1 mark)–referring to a superior as 'Sir/Madam' or 'Mr/Mrs' or 'Dr/Professor' as a sign of respect; referring to an older person as 'Mr/Mrs' as a sign of respect; referring to friends and acquaintances by their first name only; referring to good friends by a nickname; referring to partners by a term of endearment (e.g. 'Honey', 'Darling') Being polite/politeness (1 mark) Examples of use (1 mark)–making a formal request of someone who you don't know, or a superior we might use more formal language e.g., "Would it be possible to ...". When making a request of someone who we know well or in an informal relationship, we might just say "Hey, could you please ...?"	1–4
	Total 4

Question 6 (continued)

- (c) Describe **two (2)** examples of parent-child interactions that can assist with learning language.

Description	Marks
General instructions Any two examples of parent-child interactions that are explained in terms of how they assist children to learn language are acceptable for up to two marks each. Less detailed/ elaborated or well explained responses to be awarded one mark. Example correct responses • Reading together (1 mark) • Playing games together (1 mark) • Scaffolding (1 mark) • Referencing (1 mark) • Talking about things / having conversations (1 mark) • Parents talking to children about objects in the environment e.g., point to a cat and saying “look, a cat” (2 marks) • Parents talking while they are doing everyday activities with their children so children get to know words and descriptions of routines (e.g. meal-times, bath-time, shopping) (2 marks) • Parents asking children questions about things in the environment or activities (e.g. ‘what did we see when we went to the zoo today?’) (2 marks) • Parents playing simple games like ‘peek-a-boo’ that involve taking turns (2 marks) • Parents reading stories and looking at pictures with their children (2 marks) • Activities that involve joint attention, such as looking at things in the environment, reading books together (2 marks) Guidelines for incorrect responses No marks for a non-specific response that involves re-stating the question; for example: • The parent interacting with the child • Language develops through interaction with others	1–4
	Total 4

Question 7: Relational Influences

- (a) Explain how psychologists define the term 'conflict'. (1 mark)

Description	Marks
General instructions A psychological definition of the term 'conflict' must refer to the perceptions/beliefs of the people involved Examples of correct responses • The perception/belief that individuals or groups have incompatible goals, ideas or behaviour • When two parties/people/groups think differently /disagree about something • When two parties/people/groups have different ideas about something • When two parties/people/groups have a clash of ideas/philosophies/values Guidelines for incorrect responses Any response that does not include reference to psychological constructs of beliefs/perceptions/thoughts should not be awarded a mark; for example • Arguing between two people/groups/parties. • Fighting between two people/groups/parties.	1
	Total 1

Question 7 (continued)

- (b) Explain **one (1)** disadvantage that can result when someone imposes a solution on people in a conflict. (2 marks)

Description	Marks
General instructions Any correct response that explicitly explains the implications of the identified disadvantage of imposed solutions is acceptable for up to 2 marks. A response that simply names a disadvantage without explaining should be awarded one mark. Example correct responses • The solution might not be seen as fair by both people/parties (1 mark) • The people/parties might not accept the solution (1 mark) • The solution imposed might advantage one party over the other which might result in future conflict / escalate the conflict to a higher level (2 marks) • One party might be very satisfied with the solution and the other party might be very dissatisfied with the solution – there might be one winner and one loser. (2 marks) • The parties might not accept the solution imposed, so the conflict is not resolved / it might only be a temporary solution to the conflict (2 marks) • The parties lose control over working out the solution for themselves so they might not be happy with the solution imposed. (2 marks) • Financial cost/ hardship caused by having to pay an external person to resolve the conflict. (2 marks) • Even if the parties accept the solution, it will not resolve the underlying conflict between them (2 marks) • If the parties do not work the problem through themselves they don't have the chance to improve their relationship (2 marks)	1–2
	Total 2

Question 7 (continued)

- (c) State **three (3)** advantages of using mediation to resolve conflict in a relationship.

Description	Marks
General instructions Any three of the following points or any other correct response permitted for one mark each. Example correct responses • The mediator is a neutral person who does not know either of the parties and does not take sides • The mediator can help the people involved in the conflict come to a solution rather than imposing a solution • The mediator might be able to help the parties see things from a different perspective • In some types of mediation situations (e.g. arbitration), if the mediation process fails, there is still the possibility the arbitrator can impose a solution • May stop the parties ending up in court, therefore can save time and money • Possibly speed up settlement / help the parties come to a solution quicker • Parties might be more happy with the decision because they have been involved in finding the solutions, so they might be more likely to comply with it • The mediator can organise a time and venue to prevent further conflict between the parties about organising these things. • Lead to improved relationships between the parties/people will be happier and get along better • The mediator can help the parties stay on topic/not get distracted onto other topics • The mediator can help the parties to communicate respectfully rather than arguing or abusing each other.	1–3
	Total 3

Question 7 (continued)

- (d) Describe **two (2)** ways that counselling can help people to resolve conflict in a relationship.

Description	Marks
General instructions Any two of the following permitted for up to 2 marks each. Less detailed/well described points to be awarded one mark only. Example correct responses Listen better (1 mark) Be more assertive (1 mark) Communicate more effectively (1 mark) Counselling can help people learn to listen better to each other/improve their listening skills so they don't speak over the top of the other person (2 marks) Counselling can help people communicate/speak more assertively so they can get their point across without being aggressive / without being afraid to speak up (2 marks) Counselling can help people be more confident/effective/ comfortable communicating their feelings / needs / wants (2 marks) Counselling can help people understand the perspective/feelings of the other party (2 marks) Counselling can help people understand their own role in the conflict so that they can take responsibility for changing their own behaviour (2 marks) Counselling can help people understand the difference between assertive/aggressive/passive communication (2 marks) Counselling can provide a safe place in which people can express their feelings and needs / with an unbiased person (2 marks) Counselling can help people learn new skills to deal with conflict in a positive way (2 marks) Counselling can help to suggest solutions / help people come up with solutions to help resolve the conflict (2 marks)	1–4
	Total 4

Question 8: Social Values and Practice

(a) Identify **two (2)** types of 'family'.

(2 marks)

Description	Marks
General instructions Any two of the following permitted for one mark each. Any description of families corresponding to the terms below also permitted e.g. 'one parent with children'; 'a family that involves two adults and children from their previous relationships' or 'living with grandparents'. Examples of correct responses • Nuclear / biological / traditional family • Blended family • Step-family • Single-parent family • Intact • Adoptive family • Surrogate family • Extended family • Couple without children. • Other family (note this is a term listed in the Fletcher and Garton text)	1–2
	Total 2

Question 8 (continued)

- (b) Describe **two (2)** changes in social values that have led to changes in the accepted definition of a family. (4 marks)

Description	Marks
General instructions A correct response must relate to the <i>definition</i> of a family, not just the <i>roles</i> played by people within families. Stating the change in the definition of a family for one (1) mark. Describing the social value as well as the change in the accepted definition of family for two (2) marks. Example correct responses • More adults having children on their own (1 mark) • Increased acceptance of having children outside marriage (1 mark) • Divorce is more acceptable (1 mark) • Increase in rate of divorce/separation and re-partnering means that there are more blended families / step families (2 marks) • Increased opportunity for single people to become parents alone through adoption, IVF, and donor-insemination (2 marks) • Increased acceptability of fathers being the primary care-giver, means more single-parent families headed by men (2 marks) • Acceptability of assisted-reproduction techniques like IVF to allow people to have children who might not otherwise be able to e.g., same-sex couples (2 marks) • The 'nuclear family' does not have to involve two opposite sex parents who are married – increased accepted of defacto and same-sex relationships (2 marks) • An intact family might involve one adult living away from the other members for extended periods of time e.g., adults who 'fly in-fly out' or permanently live somewhere else for their work (2 marks) • Many couples choosing not to have children, therefore being a family of two adults only (2 marks) • More people choosing to stay single, so being a 'family of one' (2 marks) Examples of 0 mark responses • More women in the workforce (this does not relate to a particular definition of a family) • IVF/donor insemination (this is a change in technology, not change in social values) • People having fewer children (this does not relate to a change in the definition of a family)	1–4
	Total 4

Question 8 (continued)

- (c) Select an example of a social issue and describe how **two (2)** social values come into conflict around this issue. (Examples of social issues might include, but are not restricted to, abortion, euthanasia, refugees, commercial development of environmentally sensitive areas).

Description	Marks
General instructions Examples of social issues included in question. Any other example of a social issue is acceptable. Examples of social values that might be identified • The right of the individual to make decisions for themselves • Right to freedom of speech/right to have an opinion • Human rights to safety, security and quality of life • The right not to be affected by others' behaviour • Protection of the environment for the future generations • Individual right to commercial gain/ be successful and achieve wealth • Freedom of religion Identifying relevant social values – 1 mark each. Additional marks should be allocated according to the sophistication of the explicit explanation of the conflict between the two values (up to 2 additional marks for explaining how the two values conflict). Example responses • The social issue of abortion One social value is the right to life – this says that all forms of human life have rights, including foetuses before birth. (1 mark) A conflicting social value is the individual's right to make choices about things that affect them – in this debate, this refers to the woman's right to make the decision about whether or not she wishes to continue with a pregnancy. (1 mark) The conflict of values comes about because some people believe that the right of the foetus to life should be held above the right of the woman to make a choice about her body, and others believe that the woman's right is more important than the rights of an unborn baby. (up to 2 marks for explanation of the conflict) • The social issue of euthanasia One social value is the sacredness of human life - this says that human life should be preserved at all costs, and death should only come through natural means. (1 mark) A conflicting social value is the individual's right to make choices about things that affect them – in this debate, this refers to an individual's right to make the decision about whether or not they wish to continue living with a terminal illness, or experiencing great pain and suffering. (1 mark)	1–4

The conflict of values comes about because some people believe that the importance of sustaining human life should be held above the individual's right to choose to end their pain and suffering, and others believe that the individual's right should be the most important (up to 2 marks for explanation of the conflict) • The social issue of development of environmentally sensitive areas One social value is the protection of the land and the physical environment in its natural state/ for future generations / for cultural reasons (1 mark) A conflicting value is of individual rights to entrepreneurship / seeking wealth / development of society (1 mark) The conflict comes about when some people believe that the right to develop the man-made environment for commercial gain and benefits of society exceeds the importance of the protection of the natural environment, and criticise those who are in favour of environmental protection as 'holding back' progress. (up to 2 marks for explanation of the conflict)

Section Three: Extended answer

30% (40 Marks)

Note: The following marking guide is generic and suitable for both questions in Section Three.

GUIDE TO MARKING RESPONSES	MARKS
Use of evidence to support points	/8
Extensive (1) use of detailed psychological evidence (1) (theoretical and/or empirical evidence such as names of theorists, examples of research findings)	7-8
One (1) or two (1) examples of evidence from psychological theory and/or research that includes some detail are used to support statements (e.g., detailed description of a psychological theory or research study/findings)	5-6
Statements supported by some rudimentary psychological evidence (e.g., the name of a theorist/researcher, but no detail)	4
Statements with some personal anecdotal (e.g., personal experience) (1) or real life (e.g. information from the mass media) (1) evidence	2-3
Response is a series of generalisations that are consistent with psychological understandings, without supportive evidence (anecdotal, experiential, theoretical or empirical)	1
Response consists of vague generalisations that are not consistent with psychological understandings / are incorrect	0
Complexity of discussion/argument	/8
Sophisticated, in depth, logical argument (1) Demonstrates understanding of the complexity of human behaviour by explicitly discussing how factors related to self/others/society may interact to influence behaviour (1)	7-8
Sustained logical argument that demonstrates some understanding of how factors related to self (1), others (1) and society (1) influence the relevant behaviour.	4-6
A simple narrative showing some basic psychological understanding of the topic (1) with some evidence of a sustained argument. (1)	2-3
Discussion/argument suggests minimal understanding of the factors that influence the relevant behaviour.	1
Communication skills	/4
A well-written response with well-constructed arguments and appropriate use of psychological terms	4
Some use of psychological terms. Adequately developed sentences and paragraphs	3
Uses clear everyday language with adequate spelling and grammar.	2
Poor written English expression skills significantly impair the comprehensibility of the response (e.g., very poor spelling and grammar, poor sentence and paragraph structure).	1
Total marks	20

Question 9

Ivory Coast: Charity Fears Refugee Crisis

“Liberia is experiencing a refugee crisis following violence in neighbouring Ivory Coast ... Oxfam believes more than 100 000 people have poured over the border since the fighting between rival armies began”
(Cavanagh, 2011)

How can the **psychology of personality** and **social psychology** assist us in understanding **social values** about refugees?

In constructing your answer, you should develop a logical argument that demonstrates an understanding of factors related to self, others, and society and their interaction. Include relevant psychological evidence.

Description
General comments: Quality of response is to be evaluated according to the “Guide to Marking Responses” that shows indicative marks for different levels of each of the three criteria: Evidence used to support statements, lines for argument; Complexity of discussion/argument; Communication Skills. Example of structure and relevant evidence that candidates might draw upon: Introduction: Definition of social values – for example, “social values are what is considered important in social interactions between people” (Fletcher & Garton, 2007, p. 499). Social values can vary across cultures and for people from different social groups. Differences in social values may be related to a number of different factors related to self, others, and society. A psychological understanding of these factors can help us understand social values related to a particular issue, such as refugees. Two areas of psychology that will be discussed are the psychology of personality and social psychology. Psychology of personality Definition of personality – for example, “personality is the characteristic ways of thinking, feeling and acting that make a person an individual” (Fletcher & Garton, 2007, p. 497). There are a number of different theoretical approaches to understanding the psychology of personality. e.g., Trait approach – Allport, Eysenck, McCrae and Costa. Candidates may give examples of ‘traits’ that might be related to different values about refugees – e.g. individuals who are higher in ‘neuroticism’ may be more worried about safety concerns related to refugee arrivals, so may have more negative attitudes; individuals who are higher in ‘openness’ may have more accepting values towards refugees. e.g., Humanistic approach – theorists such as Maslow and Rogers believe that people are generally ‘good’ and that people’s personality results from people striving to achieve their potential as an individual. These theories would tend to predict positive social values about refugees, as they relate to the importance of basic human needs of safety and security, and trust in humans to make choices that are good for the human race and for the improvement of society. e.g., Learning theory – suggests that personality is learned from experiences; this would suggest that social values are likely to be related to the values of others around us, such as learned from our parents.

Social Psychology

Social psychology provides information into social behaviour, such as how people behave in groups, and how groups of people interact with each other.

Factors relevant to behaviour in groups:

Competition – for resources, social identity and status; this might lead to negative social values towards refugees.

Attribution theory – internal and external attributions of people's behaviour and the fundamental attribution error.

Group cohesion – individuals from a particular group (cultural, religious, social) may have negative views towards another group, based on the idea of group cohesion and in-group/out group behaviour. Negative values towards an out group can help to preserve or boost the status of the in group. Groups of individuals who have been refugees or experienced other hardships might identify positively with refugees as part of their 'group' and therefore hold positive social values.

Conformity and social norms – if the predominant social value is negative towards refugees, people may conform to these social norms. Important role of media reporting of events related to refugees (e.g. in Australia, the activities of refugees in detention centres) and the role of views expressed by prominent people such as politicians in providing information about refugees that can strongly affect social norms.

Candidates may talk about the interdependence of individuals and groups in society, giving examples.

Conclusion: should reiterate the point that a psychological understanding of social values towards a particular issues such as refugees benefits from considering factors related to individuals (self), others, and society.

Question 10

‘The mental health of young people is as much an issue for the community as it is for the individual.’

Evaluate this statement with reference to psychological understandings related to self, others, and society and their interaction. Include relevant psychological evidence.

General note:

The candidate may interpret the question as referring to the ‘issue’ of the *aetiology* (causes) of mental health problems, *treatment* of mental health problems, *prevention* of mental health problems, and/or the *impact* of mental health problems as pertaining to the individual and/or the community. The intended thrust of the question is to consider individual factors in interaction with social/community factors as being important contributors to mental health and mental illness.

Description
Examples of relevant evidence that candidates may draw upon. Self Biological influences— exercise, drugs, psychoactive drugs; the role of individual biology (e.g. neurotransmitters) in the aetiology of mental health problems (e.g. depression, schizophrenia); importance of research in the community on developing new drug treatments for mental health problems Cognition—behaviour change strategies for individuals with ADHD; ADHD as a biologically based condition that is related to the individual rather than their parenting/community. Symptoms of ADHD can have a negative impact on the individual as well as others around them (family, teachers, peers, community). Developmental psychology—importance of the interaction between nature and nurture in the aetiology of mental health problems. Positive family environment, supports etc as protective factors for good mental health. Personality—Maslow—individual needs for safety and security, as well as belongingness, being part of a group, are all important in development. Others Social psychology—behaviour in groups; interdependence of individuals, groups, community, group cohesion and social loafing; inclusivity and differences—individuals and groups of people who do not fit into social groups / who are socially ostracised are at risk of developing mental health problems Relational influences—availability of mediation and counselling services for people with mental health issues; adolescent groups and the importance of fitting in as part of a group for good mental health, social support etc.

Society

Culture – I link between culture and emotions

Culture – The role of psychology in preventing mental health problems / promoting mental health (see Fletcher and Garton text p. 464–465)–importance of early intervention programs, support services for people in crisis, psychological treatments; reducing stigma through education and community campaigns about mental health problems and promoting mental health and wellbeing. Involvement of wide range of agencies in the community to support families to help young people e.g. employment, education, housing, transport, community services

Social values and practices–the role of communities in supporting families; community development programs, neighbourhood programs etc.
