

PSYCHOLOGY

Stage 3

WACE Examination 2012

Marking Key

Marking keys are an explicit statement about what the examiner expects of candidates when they respond to a question. They are essential to fair assessment because their proper construction underpins reliability and validity.

When examiners design an examination, they develop provisional marking keys that can be reviewed at a marking key ratification meeting and modified as necessary in the light of candidate responses.

Section One: Research methods

20% (20 Marks)

Question 1

(8 marks)

A psychologist conducted a study to investigate the relationship between the total number of hours of television watched and total number of hours of sleep over seven days. Seven volunteer participants recorded for one week the number of hours of television they watched and the number of hours they slept. The results of the study are shown in the table below.

Participant number	Total number of hours of television watched	Total number of hours of sleep
1	35	45
2	14	50
3	9	58
4	8	60
5	5	64
6	2	67
7	8	62

The mean number of hours of television watched was 11.57 hours.

- (a) Identify the mode of the number of hours of television watched. (1 mark)

Description	Marks
8	0–1
No other answers accepted as correct	
Total	1

- (b) Identify the median number of hours of television watched. (1 mark)

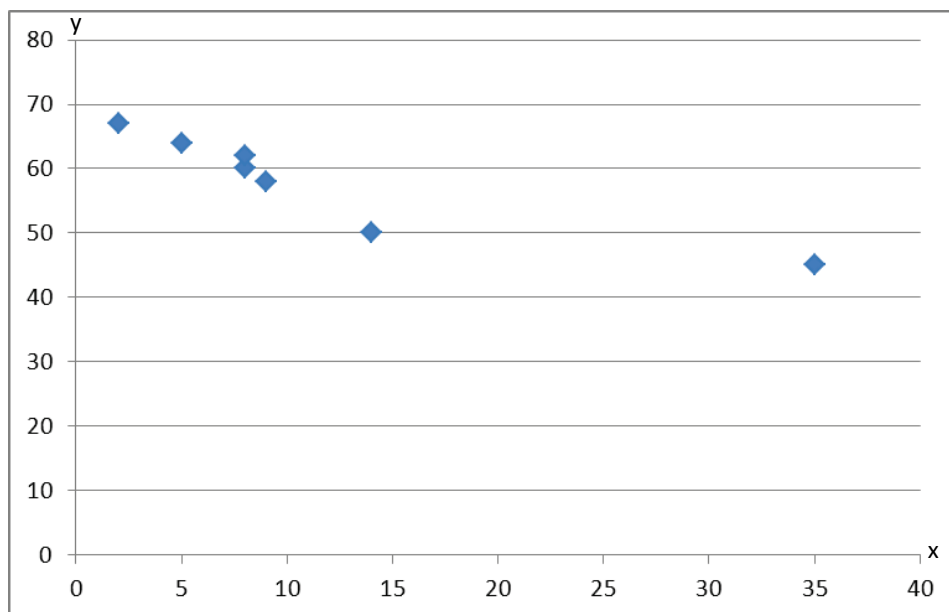

Description	Marks
8	0–1
No other answers accepted as correct	
Total	1

- (c) State **one (1)** advantage of using the median instead of the mean as a measure of central tendency. (1 mark)

Description	Marks
Examples of correct responses: - The median is not affected by extreme scores/outliers - The median is not affected by/does not depend on the size/value of the other scores	0–1
Total	
	1

- (d) Plot a scattergram of the results on the axes below. (3 marks)

Scattergram of total number of hours of television watched and total number of hours sleep in one week

x-axis label (horizontal)
(Weekly/total) television watched/hours
OR (total/weekly) number of hours of television watched

y-axis label (vertical)
(Weekly/total) sleep in hours
OR (total/weekly) number of hours sleep

Description	Marks
1 mark for correct plotting of points Visual check that the plot resembles the clustering (in the sample response) 1 mark for correct labelling of BOTH the axes (must include a reference to hours) 1 mark for correct labelling of the divisions/units on the continuous scale	0–3
Total	3

- (e) Name the type of relationship between the scores shown in the scattergram. (1 mark)

Description	Marks
Negative correlation Negative (relationship) Negative linear (relationship) Note – description of the <i>strength</i> of the relationship is not required for one mark.	0–1
Total	1

- (f) State a conclusion that the researcher could draw from the results of the study.(1 mark)

Description	Marks
Conclusion must name the variables and describe the meaning of the correlational results, not just repeat that there is a negative correlation/relationship between the variables. Examples of correct responses • A higher total of hours of television watched was associated with lower total hours of sleep. • As number of hours of television watched increases the total number of hours of sleep decreases. • People who spend more hours watching television have less hours of sleep. Examples of 0 mark responses: • There is a negative correlation /relationship between the variables / amount of sleep and amount of television watched • People who watch more television will have less sleep (Any statement that indicates a causal relationship between the two variables e.g. 'leads to...', 'results in...', negatively affects...')	0–1
Total	1

Question 2

(12 marks)

A psychologist wanted to investigate the relationship between temperature and performance on a test of divided attention. The psychologist required a sample of 60 adults to participate in the study. Each participant would complete a divided attention task under two conditions: firstly in a room where the temperature was 16 °C; and secondly in a room where the temperature was 24 °C.

- (a) Outline **three (3)** pieces of information that the psychologist must tell the participants to ensure they can give informed consent to their participation in the study. (3 marks)

Description	Marks
Any three of the below points, or equivalent, specific examples of information related to the study will be awarded one mark each: • The purpose/aims of the study • What the participant will be required to do/what the study involves • Participation in the study is completely voluntary • The participant can choose to withdraw at any time • The participant's identity/name/details will remain anonymous/confidential • The participant's information/results will be kept confidential/not shared with anyone without the participant's consent • How long the study will take • If there are any potential risks of participating in the study • Participants will be debriefed	0–3
Total	3

- (b) Identify whether this is an experimental or non-experimental study and give a reason for your answer. (2 marks)

Description	Marks
Examples of correct responses: - Experimental study (1 mark) - Because one of the variables (temperature) is being manipulated/ controlled by the researchers (to determine its effect on the other variable) (1 mark) - Because there is an independent and dependent variable (1 mark) Examples of incorrect responses: - It involves carrying out the study to test the hypothesis / the relationship between two variables. - Because the results can be statistically analysed / tested for statistical significance - Because there is a control group	0–2
Total	2

- (c) Identify

- (i) the independent variable for the study. (1 mark)

Description	Marks
(Room) temperature	0–1
Total	1

- (ii) the dependent variable for the study. (1 mark)

Description	Marks
Divided attention (task) Performance / score / results on the test (of divided attention) “Attention” not accepted for one mark	0–1
Total	1

The results of the study are shown in the table below. Higher scores indicate better performance on the divided attention task.

Room temperature	Mean divided attention score
16 °C	$\frac{49}{80}$
24 °C	$\frac{60}{80}$

A statistical test on the difference between the two mean scores found $p < 0.05$.

- (d) Explain the meaning of ' $p < 0.05$ '. (2 marks)

Description	Marks
Any correct, detailed response to be awarded 2 marks Any correct response that is unelaborated to be awarded 1 mark Examples of 2 mark responses: $p < 0.05$ means that the probability of the difference between the two mean scores being due to chance is <i>less than 5%</i>. - We can be 95% certain that the difference between the two scores is real rather than due to chance. Examples of 1 mark responses: - The results are statistically significant. - The results are not due to chance.	0–2
Total	2

- (e) State a conclusion that the researcher could draw from the statistical results. (1 mark)

Description	Marks
Examples of correct responses: The mean divided attention score at 16 °C is significantly lower than/different to the mean divided attention score at 24 °C. People performed significantly better on the divided attention task in the 24 °C room (compared to the 16 °C room). Examples of incorrect responses: Any response that refers to the statistical significance of the results or the likelihood of the results being due to chance or being due to the experimental manipulation.	1
Total	1

- (f) Identify **one (1)** source of error in the study and suggest **one (1)** way of reducing this error. (2 marks)

Description	Marks
Source of error (1 mark) Practice effect – participants might have done better in the 24 °C room because they already had practice/experience on the divided attention task. Use of repeated measures design Way of reducing error (1 mark) Use two groups of participants – Group 1 does the divided attention task in the 16 °C room first then the 24 °C room; Group 2 does the divided attention task in the 24 °C room first and then the 16 °C room (i.e. counter-balancing the order of the two conditions for the groups.) Have a break / time delay between the two tasks Use a matched-pair design Use two separate groups Note, the following are examples of responses that refer to limitations of the research design that affect generalisability of the results, <i>NOT</i> a <i>source of error</i>. Responses like this are not to be awarded marks. • The study only investigated the effect of two different temperatures. • The study only included adults. • The study only included 60 participants. • We don't know the age/gender/nationality etc of the participants.	0–2
Total	2

Section Two: Topic-related content

50% (50 Marks)

Question 3

(11 marks)

(a) Identify **one (1)** function of the

frontal lobe.
parietal lobe.
occipital lobe.
temporal lobe.

Description	Marks
1 mark for ONE correct response for each lobe	
Examples of correct responses:	
Frontal lobe - higher mental abilities - control of movement - the expression of personality - ability to reason - ability to solve problems - planning/ decision-making	0–1
Parietal lobe - concerned with body sensations/tactile sensations, e.g. pain, touch, heat - processing of sensory stimuli - the ability to orient body in space - recognition of yourself - recognition of your body including its parts - speech repetition	0–1
Occipital lobe - visual processing - visual perception	0–1
Temporal lobe - language and speech production - organising sensory input - perception and recognition of speech - perception of auditory stimuli - memory association and formation - sense of smell	0–1
Note: This is a comprehensive but not an exhaustive list of correct responses. If a candidate provides a response that is different to one of the points listed here, it is the responsibility of the marker to check the accuracy of the response to ensure correct marking.	
Total	4

- (b) Describe the effect on the production and understanding of language caused by damage to

- (i) Broca's area. (2 marks)

Description	Marks
A person with damage to Broca's area: Has difficulty producing speech (1 mark) However, they can understand language (1 mark)	0–2
Total	2

- (ii) Wernicke's area. (2 marks)

Description	Marks
A person with damage to Wernicke's area: Can produce sounds/phrases/word sequences (but without meaning). (1 mark) But has difficulty in understanding language (semantic processing/ language recognition/ language interpretation). (1 mark)	0–2
Total	2

- (c) (i) Identify the type of research into brain function that Roger Sperry conducted on animals. (1 mark)

Description	Marks
Examples of correct responses: • Split brain research • Research in which the corpus callosum is cut/severed • Research on animals that had the connection between the two sides of the brain/hemispheres cut/severed (does not have to mention corpus callosum). • Where animals have a lesion that severs the connection between the two sides of the brain/hemispheres. Examples of incorrect responses: lesions, ablation.	0–1
Total	1

- (ii) Explain **one (1)** contribution of Roger Sperry's research to the understanding of brain function. (2 marks)

Description	Marks
Examples of 2 mark responses: - Sperry's research demonstrated that the two hemispheres of the brain have different functions and the connection between them is necessary for full functioning. - Sperry's research demonstrated the lateralisation of the brain, which means that the different hemispheres of the brain perform different functions. Examples of 1 mark responses: - Lateralisation of the brain - Without the corpus callosum the brain does not function properly.	0–2
Total	2

Question 4: Developmental Psychology

(12 marks)

- (a) Name **one (1)** stage in Kohlberg's theory of moral development and briefly describe a feature of moral reasoning in that stage. (2 marks)

Description	Marks
One mark each for any one of the below levels or stages and associated features: Pre-conventional level Stage 1: Obedience and punishment Stage 2: Individual instrumental and concrete (1 mark) Features (any or equivalent for one for 1 mark) – obeying authority, avoiding punishment, making a fair exchange or a good deal. Conventional level Stage 3: Mutual interpersonal expectations Stage 4: Social system and maintenance of one's conscience (1 mark) Features (any, or equivalent, for 1 mark) – reasoning relates to pleasing others and getting their approval; following rules, doing your duty. Post-conventional level Stage 5: Rights and social contract Stage 6: Universal ethical principles and moral point of view (1 mark) Features (any, or equivalent, for 1 mark) – respecting rules and laws but recognising that they may have limits; following universal ethical principles such as equality, justice, reciprocity, respect for human life and rights. Note: A name or a stage or level is required 'Stage 1' (2, 3) is not acceptable for one mark.	0–2
Total	2

- (b) Identify and explain **two (2)** criticisms of Kohlberg's theory of moral development. (4 marks)

Description	Marks
1 mark for unelaborated, correct response. 2 marks for detailed correct response. - The stages proposed by Kohlberg have not been found to fit well with some cultures (1 mark) e.g. people from collectivist cultures refer to cultural norms about the community and social groups rather than individual values. (1 mark) - Kohlberg's research was conducted on samples of men and his stages tend to fit men's moral reasoning better than women's. (1mark) - Women's moral reason is more focused on caring and nurturing relationships rather than principles of justice, therefore women are typically rated as having lower levels of moral reasoning according to Kohlberg's stages. (1 mark) - Kohlberg's theory refers to people's reasoning assuming that this is directly related to their behaviour, but did not assess actual behaviour. - Kohlberg's theory was developed based on cross-sectional rather than longitudinal research, which does not allow assessment of an individual's moral reasoning over time. - Kohlberg's theory assumes that the progression through the levels/ stages is universal / the same for all cultures.	0–4
Total	4

- (c) Describe **one (1)** contribution of research by Carol Gilligan to psychologists' understanding of moral development. (2 marks)

Description	Marks
Examples of 2 mark responses (explains the different focus of moral reasoning for men and women) - Gilligan conducted research on men and women and found that men tended to focus more on justice and women focused more on caring when answering questions about moral dilemmas. (2 marks) - Gilligan's research found that the abstract ideal of 'justice' that Kohlberg emphasised in his theory is not as applicable to women's moral reasoning as to men's, as women tend to focus more on protecting relationships and caring about people. (2 marks) Example of 1 mark response: (mentions caring for women but does not mention the focus of moral reasoning for men or that Kohlberg's theory focuses on 'justice') - Women focus more on caring and relationships than men. (1 mark)	0–2
Total	2

- (d) Choose any **two (2)** stages from Kohlberg's theory of moral development. For each stage, explain the relationship between moral reasoning and cognitive development by referring to one of Piaget's stages of cognitive development in childhood and adolescence. (4 marks)

Description	Marks
For two marks, the candidate must explicitly describe the relationship between the stage / level from the two theories. Examples of correct responses: In <i>Kohlberg's Pre-conventional level</i> of moral reasoning people are unable to see multiple perspectives; focus on one/own perspective. This is parallel to <i>Piaget's pre-operational stage</i> of cognitive development in which children are believed to be egocentric and have difficulty understanding alternative points of view. (2 marks) In <i>Kohlberg's Conventional level</i> – focus on concrete rules and laws. This is parallel to <i>Piaget's concrete operational reasoning</i> in which children can solve problems using physical materials but are unable to reason abstractly / consider abstract information. (2 marks) <i>Kohlberg's Post-conventional level and Piaget's Formal operational stage</i> – people are able to reason abstractly and consider multiple perspectives at the same time. (2 marks)	0–4
Total	4

Question 5: Social Psychology (8 marks)

- (a) (i) Define 'deindividuation'. (1 mark)

Description	Marks
Any correct definition accepted for 1 mark. Examples of correct definitions: "Abandoning usual restraints to join in group behaviour." (Fletcher & Garton, 2007, p. 493) "A psychological state occurring in group members that results in the loss of individuality and the tendency to do things not normally done when alone." (Bernstein, Penner, Clark-Stewart & Roy, 2012, S9)	0–1
Total	1

- (ii) Name and describe **two (2)** factors that have been proposed to explain 'deindividuation'. (2 marks)

Description	Marks
Examples of correct responses: Anonymity: If people believe that they are anonymous / not able to be identified in a group, they might be more likely to do things that they would not do as an individual/when alone. (1 mark) Shift of attention: In a group situation people's attention may shift to external factors rather than from their own thoughts/beliefs or evaluation of a situation which makes them more likely to follow group behaviour. (1 mark) Increased awareness of social norms: In a group situation a person may be more aware of social norms and want to fit in with those norms, leading them to do things that they might not do if they were alone. (1 mark)	0–2
Total	2

- (b) Name and briefly outline **one (1)** psychological theory that explains why competition can occur between groups of people. (2 marks)

Description	Marks
Up to two marks to be awarded for either of the following theories: Realistic conflict theory (1 mark) Competition arises between groups when people are competing for scarce but valued resources (e.g., physical resources, rewards/prizes, status). (1 mark) OR Theory of relative deprivation (1 mark) Even if there are plenty of resources to go around / resources are not scarce, groups tend to compare themselves with other groups and competition can arise if one group perceives that another group is better off than they are. (1 mark)	0–2
Total	2

- (c) Four students were required to work together to complete a project. Using your psychological understanding of social loafing, describe **three (3)** strategies that the students could use to reduce social loafing in the group. (3 marks)

Description	Marks
General principles are provided as a guide to themes that the examples might relate to. One mark to be awarded for either reference to a general principle with an example, OR a specific example of a strategy related to each general principle. More than one strategy relating to each general principle is permissible as long as the examples are clearly different. • General principle: Increase motivation in the group by, for example; - Choose a topic that everyone is interested in - Set a goal to achieve the best result possible - Plan a reward for the group at the end of the project. • General principle: Individual contributions need to be essential for success; for example, - Divide up the project so that everyone has a part to do - Let people do a part of the project that they are most interested in or good at. • General principle: Monitor individual performance - Have regular meetings where people discuss/bring in what they have done. • General principle: Individuals need to identify strongly with the group - Develop a 'team name' - Plan a group reward at the end of the project.	0–3
Total	3

Question 6: Communication

(9 marks)

- (a) Define 'persuasive communication'. (1 mark)

Description	Marks
Any correct definition accepted for one mark. Examples of correct responses: - Communication that aims to induce or urge the adoption of certain beliefs, theories or lines of action by others. - Any message that is designed to shape, reinforce or change the response of another person / other people.	0–1
Total	1

- (b) List **two (2)** characteristics of an audience that could affect the style of presentation used for persuasive communication. (2 marks)

Description	Marks
Any of the following or any other reasonable response accepted for one mark each. Examples of correct responses: - age - relationship to the deliverer of the communication - personality - level of education - cultural background - need for cognition - initial attitudes on the issue (stronger initial attitudes are more resistant to change).	0–2
Total	2

- (c) Identify and explain **one (1)** factor relating to a person as the source of a message which would enhance the persuasiveness of the message. (2 marks)

Description	Marks
Examples of correct responses: 1 mark for identifying the factor and 1 mark for explanation - A person who is seen as an 'expert'/credible/ has a high profile in an area (1 mark) – experts are seen as more trustworthy / more knowledgeable and competent / people are less likely to want to assess the validity of the claims made by an expert (1 mark) - A person who talks fast (1 mark) – research has shown that listeners perceive fast talkers as more knowledgeable and intelligent (as long as they can understand what the person is saying) (1 mark) - A person who is seen as more trustworthy (1 mark), for example based on their previous behaviour or what another person has said about them, is more likely to persuade someone (1 mark) - If the person is perceived by the audience as similar (1 mark) to themselves in ways that are relevant to the issue at hand (1 mark) - The likability of the person (1 mark), for example physical attractiveness can impact upon likability and can make a person more persuasive (1 mark) Examples of one mark responses - Expertise - High profile / celebrity - Trustworthiness - How knowledgeable the person is seen to be - Likability - Attractiveness - Similarity	0–2
Total	2

- (d) Identify **two (2)** persuasive communication techniques that are used in the following advertisement and explain how they contribute to its persuasiveness. (4 marks)

Description	Marks
Any correct technique (1 mark each) and correct explanation of its use in the advertisement (1 mark each) are accepted for up to 4 marks. Techniques could include, but are not limited to the following examples: Gaining the attention of the viewer, for example: - Explanation may involve the use of the large headline or the pictures 'coming out of the page' in gaining the attention of the viewer Ease of comprehension of the message, for example: - The message in the text about paying \$1 for tap water in a restaurant to help UNICEF provide clean drinking water to children in need is very clear and direct Provoking an emotional response in the viewer, for example: - The reference to children dying of water-related diseases is an example of a message designed to provoke an emotional response in the viewer. - Symbolism in the multiple hands on the advertisement	0–4
Total	4

Question 7: Culture

(10 marks)

- (a) Define 'mental health'. (1 mark)

Description	Marks
Any correct response accepted for one mark. Examples of correct responses: • Psychological well being • Emotional and social well being	0–1
Total	1

- (b) (i) Briefly outline **two (2)** considerations in defining behaviour as 'abnormal'. (2 marks)

Description	Marks
Examples of correct responses: Any of the following, or equivalent, accepted for one mark each: Whether the behaviour: • Is considered statistically average/statistically normal/ or common amongst a group of people • Is appropriate for a particular situation or occasion • Is appropriate for a person of a particular age • Allows the person to function independently and appropriately in society / interferes with the person's life • Does not have a (medical) psychological diagnosis / does not meet criteria for a diagnosis • Is acceptable in a particular society / cultural context at a particular time Guideline for incorrect responses: No marks to be awarded for a one-word response that names a consideration only – requires some description for one mark.	0–2
Total	2

- (ii) Explain briefly why there are cultural variations in the definition of abnormality. (1 mark)

Description	Marks
Examples of correct responses: Judgements of what is normal depend on different cultural values. Behaviour that may be considered deviant or maladaptive in one culture may be quite acceptable and adaptive in another culture due to different norms.	0–1
Total	1

- (c) Describe **three (3)** differences between Psychodynamic Therapy and Cognitive Behaviour Therapy (CBT). (6 marks)

Description	Marks
The general points are examples of key areas of difference between Cognitive Behavioural Therapy and Psychodynamic Therapy. The descriptions are examples of correct descriptions of the differences related to the area. Any equivalent description of a key difference is acceptable for up to 2 marks. For 2 marks for each point, the candidate <i>must describe</i> the difference between the two approaches by <i>referring to the characteristic of each approach</i>, not just <i>name a difference</i>. • General point – Duration CBT is a time-limited brief therapy, for example, 8–12 sessions, whereas Psychodynamic Therapy is usually long term lasting for up to several years. • General point – Degree of structure CBT is a structured form of therapy where the plan and goals for each session is set out at the start. Psychodynamic therapy is not structured and instead depends on what the person feels like talking about at any time. • General point – Focus on the present versus the past In CBT, the focus of the work is on the person's thoughts and behaviours in the present time and helping them change these to be more adaptive. In Psychodynamic Therapy there is much more focus on the person's past experiences/childhood. • General point – Goal of the therapy In CBT, the goal of the therapy is to help the client to change their thought patterns and behaviours. In Psychodynamic Therapy the goal is gaining insight into and understanding of one's behaviours and thought patterns / understanding of why people feel or behave as they do rather than specifically changing thoughts or behaviours. • General point – Role of the therapist In CBT the relationship with the therapist is considered important for the success of the therapy, but is not a specific focus of the therapy. In Psychodynamic Therapy the client's relationship with the therapist is a specific focus of the therapy. • General point – Use of homework Homework activities in which the client practices new skills/behaviour is considered central to the success of CBT but homework is not typically used in Psychodynamic Therapy. Brief, unelaborated but correct responses to be accepted for one mark. Examples of 1 mark responses: • CBT is shorter than Psychodynamic Therapy. • In CBT the focus is on changing negative thinking patterns/cognitions.	0–6
Total	6

Section Three: Extended answer

30% (56 Marks)

Question 8

(28 marks)

Discuss the factors that contribute to a Psychological Sense of Community in a social group.

In constructing your extended response, you should:

- define Psychological Sense of Community;
- identify and describe the four elements of the McMillan Chavis (1986) Model;
- include examples of psychological evidence related to this model; and
- apply your knowledge of the model by referring to examples related to a specific type of social group (for example, a classroom, school, sporting team, club, online chat site).

Marking Criteria	Marks available
Definition of 'Psychological Sense of Community'.	3
One mark for each component of the definition, which may include any of the below points for one mark each: • Feeling of belonging • Interdependence between the individual and the group • A feeling that members matter to one another and to the group / sense of mutual commitment • A shared faith that members' needs will be met through their commitment to be together • Strength of bonding between group members	0–3
No definition provided.	0
Identification and description of the four elements of the McMillan and Chavis (1986) Model.	12
One mark for naming each element Up to 2 marks for the description of the element. • 2 marks for detailed accurate description • 1 mark for accurate but less detailed description • 0 marks for inaccurate or no description	3 per element
Membership	1
Examples of correct descriptions (not all required for 2 marks) • Refers to a feeling of belonging or a sense of personal relatedness to the community; feeling that one has invested part of oneself to become a member of a community and therefore has a right to belong • Establishment of boundaries – identification of the difference between in-group and out-group members • Emotional safety – protection of intimacy in the group; individual's feeling of safety to reveal aspects of themselves in the group • Personal sense of belonging and identification – sense of being accepted and expectation or faith that one will belong to the community • Personal investment – individual's sense that they have earned membership of the group due to their contribution • Common symbol system – a means of identifying who belongs in a community	0–2
Influence	1
Examples of correct descriptions (not all required for 2 marks) • Refers to a sense of mattering, or making a difference to the group, and the group mattering to its members • This is a two-way relationship between the community and its members • Members are more attracted to a community in which they feel they are influential	0–2

Integration and fulfilment of needs	1
Examples of correct descriptions (not all required for 2 marks) - Feeling that members' needs will be met by the resources received through their membership of the group - Positive reinforcement received through membership of the community	0–2
Shared emotional connection	1
Examples of correct descriptions (not all required for 2 marks) - The commitment and belief that members have, and will share history, common places, time together, and similar experiences - Refers to an intangible, spiritual bond that develops between members based on the quality of interactions within the community	0–2
Use of psychological evidence to support discussion. Note: It is acceptable for all research examples to come from the work of McMillan and Chavis.	5
Two or more examples of detailed psychological evidence (e.g., summary of key research findings as well as details of study and name of researcher)	5
One (1) or two (2) examples of evidence from psychological research that includes some detail (e.g., name of researcher and basic description of the study or findings)	3–4
Statements supported by some rudimentary psychological evidence (e.g., the name of a researcher but no detail of the research conducted, or basic description of a research study with no name)	2
Some personal /real life examples provided as evidence	1
No supporting psychological evidence or all evidence is incorrect	0
Application of knowledge of The McMillan-Chavis (1986) Model to a specific social group as part of discussion.	5
A specific social group is identified and knowledge of The McMillan-Chavis (1986) Model is utilised effectively to discuss the development of a Psychological Sense of Community within the specified social group.	5–6
A specific social group is identified and some evidence of accurate knowledge of The McMillan-Chavis (1986) Model is demonstrated in the discussion about the development of a Psychological Sense of Community within the specified social group.	3–4
A specific social group is identified but the application of knowledge of The McMillan-Chavis (1986) Model in the discussion of the development of a Psychological Sense of Community is generalised and /or has some inaccuracies.	1–2
No evidence of application of knowledge of The McMillan-Chavis (1986) Model to a specific social group is demonstrated.	0
Communication Skills:	3
Well-constructed argument; well-developed sentences, paragraphs; uses appropriate psychological language with accurate spelling, grammar, and punctuation.	3
Clear everyday language with adequate spelling, grammar, sentences and paragraph structure	2
Poor literacy skills interfere with the ability of the marker to understand the response (e.g., very poor spelling, grammar, poor sentence and paragraph structure).	1
Response is unable to be understood	0
TOTAL MARKS:	28

Acknowledgement : Key information about the elements of the McMillan-Chavis Model taken from Curriculum Council Presentation December 2011, Professor Lynne Cohen and Dr Bronwyn Harman

Question 9

(28 marks)

Apply your psychological understandings of **two (2)** theories of personality to explain the behaviour and characteristics of the person in the following scenario.

In constructing your extended response, you should:

- define ‘personality’;
- describe each of the **two (2)** theories and name key theorists;
- relate each theory to Kate’s behaviour and characteristics; and
- outline the contributions and limitations of each personality theory.

Marking Criteria:	Marks Available:
Definition of personality	1
Any correct definition of personality is acceptable For example: “the characteristic ways of thinking, feeling and acting that make a person an individual”	1
No definition included	0
Identification of theories of personality	8
Scenario has been designed to be applicable to Trait theory and Humanistic theory. Candidate <i>may</i> describe Psychodynamic Theory/Freud or Social Cognitive theory/Bandura in this part and should be awarded marks according to the criteria below. Mark allocation: • Naming and describing theory – 1 mark for correct name; 1 mark for correct description • Naming key theorists – 1 mark for each theorist, up to 2 marks Trait theory (1 mark) – trait theories claim that there are stable, enduring characteristics of people that can be identified, described and measured and used to explain differences between people; traits are believed to have a genetic basis (1 mark) Examples of theorists: Eysenck, McCrae and Costa, Allport (up to 2 marks)	0–4
Humanistic theory (1 mark) – based on the assumption that people are inherently good and personality results from people striving to reach their potential in life; people are motivated to achieve their potential. (1 mark) Examples of theorists – Rogers, Maslow (up to 2 marks)	0–4
Relate the theory to Kate’s behaviours/characteristics	8
Trait theory – examples of correct points • Identifies behaviours consistent with Introversion as a trait (1 mark) and relates this to Eysenck’s model (1 mark) • Identifies behaviours consistent with Conscientiousness as a trait (1 mark) and relates this to Costa and McCrae’s Big 5 model (1 mark) Any other correct examples of traits with no reference to theories (e.g. kind, caring) – one mark only	0–4
Humanistic theory – examples of correct points • Identifies that Kate is described as a helpful and kind person which is consistent with being ‘naturally good’ (1 mark) and relates this to Rogers theory (1 mark) • Identifies that Kate is motivated to realise her potential in terms of	0–4

achieving her goal of being a psychologist (1 mark) and relates this to either Maslow's or Rogers' theory (1 mark) Identifies that Kate has her lower needs on the hierarchy of needs met (physiological, safety and security, belongingness) and is working on her esteem and self-actualisation needs (1 mark) and relates this to Maslow's Hierarchy of Needs (1 mark) Any two or more of these, or other correct responses related to theory to be awarded up to 4 marks	
Contributions and limitations of each theory	8 marks
The following represents examples of correct responses. All other responses to be evaluated for correctness and awarded marks accordingly.	
Trait theory Key contributions (up to 2 marks for detailed description; 1 mark for brief, unelaborated correct point) - Contribute to research on personality development - Work on understanding different personality types Key limitations (up to 2 marks for detailed description; 1 mark for brief, unelaborated correct point) - No agreement on the number of traits / different number and name of traits in different theories - Characteristics may be better considered predispositions to act in certain ways rather than 'traits' - Debate about the degree to which traits are inherited versus developed through interaction with the environment - Fail to take into account unconscious processes	0–2 0–2
Humanistic theory Key contributions (up to 2 marks for detailed description; 1 mark for brief, unelaborated correct point) - Influential in psychotherapy, parenting and business - Influenced study of healthy as well as unhealthy personality Key limitations (up to 2 marks for detailed description; 1 mark for brief, unelaborated correct point) - Hard to test scientifically, based on clinical observations - Fundamental premise that all people are inherently good is considered too optimistic and unrealistic	0–2 0–2
Communication skills	3
Well-constructed argument; well-developed sentences, paragraphs; uses appropriate psychological language with accurate spelling, grammar, and punctuation.	3
Clear everyday language with adequate spelling, grammar, sentences and paragraph structure.	2
Poor literacy skills interfere with the ability of the marker to understand the response (e.g. very poor spelling, grammar, poor sentence and paragraph structure).	1
Response is unable to be understood.	0
TOTAL MARKS:	28
