Name: _____

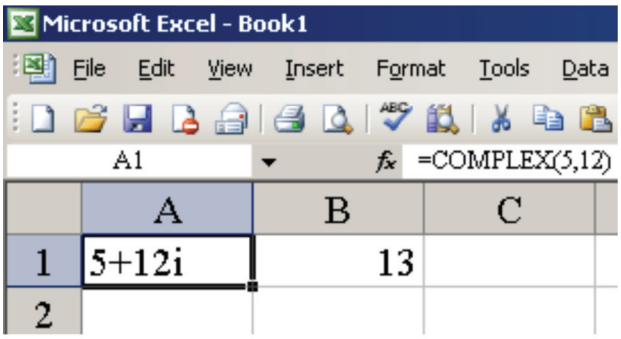

SPREADSHEET TASK 2

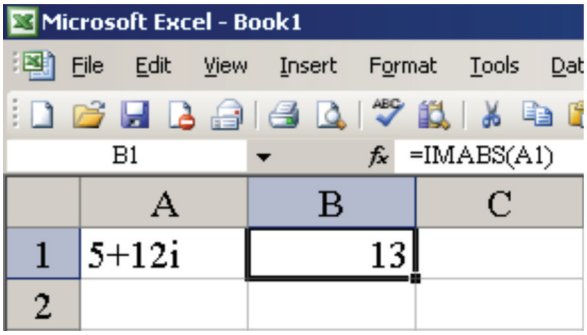

Evaluating the modulus of a complex number 2

It is possible to use *Excel* to find the modulus of a complex number by entering the real and imaginary parts respectively into separate cells, then using the formula function.
Program according to the table below.

	A	B	C	D
1	$5 + 12i$	5	12	= SQRT(B1^2 + C1^2)
2	$3 - 4i$			
3	$-8 + 6i$			
4	$-15 - 8i$			

You could also use the = COMPLEX() and = IMABS() functions instead, as shown in the screenshots below. The other complex functions available in the Engineering category of functions in *Excel* also begin with "IM".
